Ag Clutch cover interchange OE / AFTERMARKET

original

original

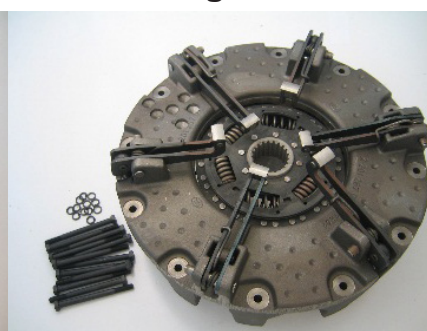

original

example (1)

example (2)

example (3)

The original clutch fitted and the replacement clutch often vary between manufacturers. Ag Clutch supply the same clutch as originally fitted where possible - however this may be replaced by an alternate aftermarket version.

Example 1

The alternate cover may appear slightly different, for example the original cover may have 9 bolt fixing where the aftermarket has 12 bolt fixing - the extra holes are not used.

Example 2

The clutch disc fitted is sometimes upgraded or rationalized to ceramic type and the clamping method may be different.

Example 3

The length of the cover fixing bolts may vary, with the alternate version requiring a new bolt set. This is only when the actual bolt fixing height of the covers can vary between the manufacturers.

Apart from the above differences these covers interchange directly, without the need for special modification.

Ag Clutch advises not to interchange the original & aftermarket clutch plates as quite often the thickness of the facings and hub offset may vary substantially between manufacturers. Mixing the components may cause release problems or premature clutch disc and cover failure.
